Predict

A fire detection app built using Flask is a web application designed to monitor and identify potential fire hazards in a specific area, often through the use of sensors or image recognition. Flask, a lightweight Python web framework, allows for easy integration with machine learning models or sensor data, providing a real-time interface to track fire.

## Output

Predict

THE FWI prediction is  
12.819936280968388

This denotes that there are **12.8199362809** chances of forest fire in that particular region. If it was high then certain action can be taken in future to avoid forest fire.
